What's New In?

To make sure our files are protected from unauthorised access and leaks, we use a powerful encryption tool. It helps us to send files via P2P networks and it protects our sensitive information in case of network and Internet attacks. It is also useful when we want to disguise our message in case someone is eavesdropping over the conversation. There are many types of cryptographic algorithms which help us to generate and encrypt our files. Each of them has its pros and cons. It depends on the needs whether we use some of them or all of them to make sure our data is safe. We recommend to use all types of algorithms for all files, even if you don’t plan to encrypt some of them. It is really hard to make our files unreadable for anybody even if they are present on the Internet and anyone has access to them. Here you can find a list of algorithms which you can use and enjoy. 1. The File Encryption Algorithm (FEW) The FEW (For Encrypting Files With eXplicit Werte) method is one of the most popular and reliable methods of text encryption. It was developed by Jon Lechner and Bertram Poettering in 1998. Its purpose is to encrypt plain text with any size by splitting it into 16 bytes, and converting them into 64 bytes of binary data, which are then converted into text. The system consists of three stages: First, a file is split into 16 bytes (Line 1). Second, each of the 16 bytes is converted into a 64-digit binary string (Line 2). The 64-digit binary string is converted back into the original text (Line 3). This is how the encrypted text is generated: Line 1: 56 01 02 03 04 05 06 07 08 09 0A 0B 0C 0D 0E 0F Line 2: 22 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 Line 3: AA 61 47 E3 7E 30 D5 8D 77 69 DA 23 6C 4A D6 27 B3 Decrypting the file In order to decrypt the file, you have to do the reverse steps by selecting the same file and the same password as above. When you press the “Decrypt” button, the program will create another file containing your plain text. 2. The Data Encryption Standard (DES) The Data Encryption Standard (DES) is the most commonly used encryption algorithm. It was created in 1977 by the US National Bureau of Standards and was later distributed by the US Government Printing Office in 1977. The DES algorithm is currently a part of the Federal Information Processing Standards Publication 46 (FIPS PUB 46). The National Institute of Standards and Technology (NIST) has determined that the original version of DES is not adequate for today’
