Art For convenience and economy, gas-fired ovens used in home and commercial environments are generally incorporated in a plurality of single fuel appliances which receive gas from a centrally located gas supply. An appropriate selection of appliances for a particular area is employed, such that each appliance may be operated independently. In the case of a residential area, such as a single family home, for example, it is typical to have a small gas-fired range (about 18 inches high), a microwave oven, and a conventional gas-fired oven. In a commercial installation, the gas-fired oven would be employed to cook large numbers of meals at one time. It is desirable to control the supply of gas to each appliance so that a relatively constant temperature is maintained in each appliance, and the maximum flow of gas to each appliance is utilized. Such controls are called for in, for example, the United States Navy, where in several of the larger ports, large numbers of meals are prepared and are served from a single oven. In addition to limiting the gas consumption, the conventional gas-fired ovens are employed to
