Akilam Potrum Bharatham Song Free 109.Q: Nested oracle query I am working on learning Oracle Apex for the first time, and I'm struggling with simple SQL queries. I have a table called Customer and I need to write a query that will return three columns: Customer (id) Orders (id, customer_id, quantity) I'm new to SQL, and I'm trying to understand how to write this. I have successfully written queries for two queries: id column in the Customers table (using sql_id() function) id and quantity of an Orders table (using sql_number()) But how to combine both of the two queries into one query that would return information on how many orders were placed per customer? A: select c.id, o.id, o.quantity from customer c join orders o on o.customer_id = c.id This will join both tables together, and return all the columns from both tables. * * For the full copyright and license information, please view the LICENSE * file that was distributed with this source code. */ namespace Predis\Configuration; /** * Splits arguments into an array of sections, * returning a configuration array. * * @author Daniele Alessandri */ interface SectionArgumentInterface { /** * Checks if argument is a section. * * @param string \$arg Argument to check. * * @return bool */ c6a93da74d
