All the 128 samples.Q: Creating a struct on the stack I've looked at some examples of doing this, and I'm a little confused. I understand why this doesn't work: struct tup { int i; char *c; tup *v; }; But I'm wondering how this does work: struct tup { int i; char *c; }; tup *q = malloc(sizeof(tup)); Can someone explain how this works? A: Both of these are OK as long as you don't try to create an instance of tup. You can create an instance of the struct pointer in the latter case, because you haven't statically allocated memory for the members. At the end of both cases, the memory is managed by the C library and it will not return the pointer to your stack allocated object. That's why you can't do this: struct tup *p; p = malloc(sizeof(struct tup)); A: tup is a pointer to a struct. You can create a new pointer to a struct, but you can't create an instance of the struct. tup *q = malloc(sizeof(tup)); tup is a struct. You can create an instance of it and then allocate memory for its fields. struct tup { int i; char *c; }; struct tup *q = malloc(sizeof(tup));

Coated on Ti6Al4V for Bone Tissue Engineering. This study provides a route for fabrication of nanostructured biomimetic hydroxyapatite (Nano-BHA) coated on Ti6Al4V (Ti6Al4V-Nano-BHA) with nano-sized BHA (nBHA) coating on Ti6Al4V (Ti6Al4V-nBHA) as a bone-implant material through layer-by-layer chemical assembly process. The fabrication of the two-layered Ti6Al4V-nBHA system is not simple since the nBHA particles are in the range of nanoscale and relatively large. Hydroxyapatite, another very interesting material in bone graft and implant applications is known to be more biocompatible than titanium due to its structure and similarity in composition with biological apatite. The proposed biomimetic synthetic hydroxyapatite was synthesized by hydrolysis of H₃PO₄ on Ti6Al4V. X-ray diffraction spectra showed that hydroxyapatite (HAP) was deposited on the Ti6Al4V substrate. Fourier-transform infrared spectroscopy has been used for studying functional groups on the surface. Field emission scanning electron microscopy studies have confirmed the surface morphology and dimensions of the nBHA particles. In vitro dissolution tests showed that the nBHA coating can suppress the dissolution of Ti6Al4V substrate. In vivo implant test in dogs showed that the tested Ti6Al4V coated by nBHA has higher in vivo bio-compatibility than pristine Ti6Al4V.
