Adobe Photoshop Express is a free option that lacks many Photoshop features. It's a good tool for simple photo editing for more casual photographers who don't have to be as professional with their work.

4. Images in Photoshop have layers that can be moved, deleted, expanded, and changed in all kinds of ways. When you load a page into your browser, your images come in as layers. You can change the position of any of the image's layers to adjust the position of the image on a web page. The layers in an image can also be changed to a lighter or darker hue, as well as tinted with various tones of color.

You can use Photoshop to remove unwanted objects in an image. You can also apply filters to manipulate the appearance of a photo. Filter effects on websites look quite different depending on the type of browser used to view the site. Use filters on your designs the same

way you'd use them in Photoshop, but they may look a little different in a browser. 5. You can add text or decorative items to a web page by using a text box or adding a graphic to the page. You can also add text directly to a graphic — no need to add a separate layer for text.

Adding Text to a Graphic Select the text tool and click on the graphic on a web page to create an anchor tag. Select a font, size, and color, and you're ready to add text to a graphic image. Just to be clear, you can only add text to a graphic on a web page and not a CSS file. CSS files only support styling information and are used for including style sheets, for example, for fonts, colors, spacing, and so on. Follow these steps to add text to an image: 1. Select the text tool and click on the image on the web page. 2. Select the type of text you want to add. The options include font, font size, font color, and text underlined or not, as shown in Figure 5-9. **Figure 5-9:** You can choose from a variety of font styles for the text you add to the image. 3. Choose the position for your text in the image. You can select text that wraps around an image and place it where you like in the image, or you can position a static line of text. 4. Click and drag to move the text where you want it in

The functions of Photoshop Elements are split into a few categories. These can be found on the toolbar on the right: •**Edit:** To the left of the Edit button you will see two tabs, which will enable you to change the size of the image, transform it (e.g. rotate it), paste it or add the watermark. Above the tabs is a button, which allows you to open a file. •**Adjust:** To the left of the Adjust button you will find a variety of tools which will make it easy for you to improve the quality of

your work. These tools include: Levels, Curves, Layers, Clarity, Sharpen and Noise Reduction. •Window: The window can be used to open, close and select files or open new images. •Filters: In this category you can find a number of filter options. The filters include Soft-Round, Blur, Sharpen, Screen, Posterize and Soften. •Draw: In this category you will find the Draw tool which will enable you to draw shapes, lines, and even text. •Window: This button will allow you to close or open the window. •Help: The Help button will help you to read more about the use of the program and complete the free tutorials. Getting Started Photoshop Elements is accessed using the mouse. Click on the "Photoshop Elements" logo on the screen to open the program. If you are already using Photoshop Elements, you may find the program will load almost instantly. The program opens with a classic Photoshop interface, which is very similar to Photoshop. This interface includes five tabs: •File: The File tab enables you to access your images, to view the image in a preview window, and to open other image files. The files are arranged in two columns on the left side. On the right side of the file window you will find a preview window. •View: The View tab shows your image in different sizes. The different sizes include: 200%, 400%, 600%, 1,000%, 1,200%, 2,000%, 3,000% and 4,000%. To zoom in on the image, just click on the "+" sign. When the zoom in is complete, hold down the Ctrl key and click to zoom out. •Windows: The Windows tab allows you to switch between open windows. You can 05a79cecff

Transmission and structure-function correlations in *Drosophila* circadian clock: how the long delay between transcriptional and translational initiation of Period results in a fast oscillator. The mammalian circadian clock is based on a transcription-translation feedback loop that is adjusted to the circadian period by post-transcriptional mechanisms, involving alternative splicing, mRNA stability, and translation initiation. The *Drosophila* clock is based on a transcriptional feedback loop and has a much longer period than the mammalian clock. To understand the molecular basis of this difference, we used a cell-based assay to study the correlation between transcriptional and translational events. We found that the long period is due to a significant delay between the initiation of transcription and translation of the Period protein. This delay is due to a long mRNA transit time from transcription to translation. The protein scaffold of the clock is a transcription factor, CLK/CYC. It is shown here that CLK/CYC-binding to its own promoter is rapidly competed off by PERIOD (PER) mRNA binding. However, the translation-initiation factors eIF-1A and eIF-4E are present at the PER mRNA, and can then be displaced by the AP3/PTC mRNA. These results may provide a new understanding of the structure-function correlation that maintains the fast period of the *Drosophila* clock.

Cell-mediated immunity and development of atopic disease. Atopic diseases such as bronchial asthma and food allergy are inflammatory disorders of the airways and gastrointestinal tract. Atopic diseases are induced by external stimuli through atopic predisposition, but the mechanism remains unknown. Because it is generally accepted that allergy is a type of inflammation, we have

investigated the nature of cells involved in these inflammatory reactions. For this purpose, the cutaneous delayed hypersensitivity reaction, anaphylaxis and the leukocyte migration inhibitory factor assay were examined in 19 atopic patients and 15 non-atopic subjects. The comparison of the results in the two groups revealed no significant differences in these tests. There was also no difference in the in vitro lymphocyte reactivity against the antigens, in the secretion of soluble factors by the mononuclear cells, and in the phagocytic activities of peripheral blood polymorphonuclear leukocytes, macrophages and lymphocytes. These results suggest that in the development of atopic diseases, cells other than lymphocytes and monocytes play a major role in the immunological mechanisms, rather than
